

The blasting company's working day, on one device.

Drill plans, drill logs, the blasting log, the daily report, rig checklists and time cards: entered once, calculated for you, filed as the record.

One day, start to finish.

- 1 Plan the pattern**
Rows, columns, depth and spacing. Sent to the drillers with the date.

- 2 Drill it, over days if it takes days**
One drill log for the pattern. Every hole carries its driller, rig and time.

- 3 Make the shot from what was drilled**
The layout becomes the shot's diagram and the totals come from the drilling.

The site, with the ring.

Pin the blast and the structures, set the blast radius, and the closest structure feeds the compliance card and the printed log. Satellite or street, saved with the shot.

Timing you can see.

Tap the first hole and its lead, then wire the rest. Firing times fall out of the tree, the 8 ms rule is checked as you go, and the timing sits on the pattern as it was actually drilled.

- 4 Time it, map it, check it**
Timing, the site map, scaled distance and PPV on one screen.

- 5 Check and sign**
The app says what is still missing before the signature.

- 6 File this day**
Red items must be fixed first. Then the papers are the record.

Scaled distance, PPV and K, worked as you type.

Charge per delay, the closest structure and the site's K factor. The scaled distance and predicted PPV update as the shot is entered and are checked against the USBM RI 8507 and OSM limits. Photograph the seismograph printout and the readings fill themselves, on the device, with no signal.

Drillers have their own home.

The pattern is a paper of the job. Drillers continue one log over days, each hole carries its driller and rig, as well as hazard details for the blaster. The pattern turns Drilled by itself upon completion and the blaster accepts it in one tap.

The office sees the whole company.

Who has checked in, what is filed and what needs a decision. Review with send-back notes, approvals, and Records by job, day and pattern. A filed copy is write-once. A correction is a new version with the old one kept. Every filing is audited on the server and kept for the retention periods the regulators require.

SAFETY

Safety lives on the job.

A jobsite contact sheet with the fire chief, the police and the nearest hospital, and one-tap directions to the hospital and urgent care. Incident reports open with a Do-now list that dials the right people, keep a call log, and reach the office the moment they sync.

Built for the record.

ATF explosives records, OSHA and MSHA safety rules, DOT transport rules, Massachusetts 527 CMR and every town's blasting permit rest on these papers. ShotLog treats them as the legal records they are.

ATF

OSHA - MSHA

DOT

MA 527 CMR

USBM RI 8507

OSM

TOWN PERMITS

WHO USES IT

Built for the whole crew.

Blaster, driller, supervisor, mechanic, office and admin. Each opens on what needs them today. Roles are bundles of permissions the company can adjust, and the server enforces every one.

BLASTER

DRILLER

SUPERVISOR

MECHANIC

OFFICE

ADMIN

OFFLINE

No signal needed.

Everything works offline on an Android tablet, a phone or a PC. Changes sync when a connection returns, and two people can work the same day without overwriting each other.

See it on your own job.

Half an hour on a call, or a morning at your site. Bring last week's blasting log.
